

Dear Recruiter,

It's a pleasure to meet you. I am currently a Master's student in Computer Science at The University of New Mexico. I will be completing my graduation this May 2016. I am very interested in this role that has been posted in your career site. I have strong understandings of Algorithms and Data Structures and pretty comfortable with languages such as Python, Java, PHP and big data frameworks like Hadoop, MapReduce, Spark, Hive, Mongo DB, Pig, Sqoop etc. You can have a look at my repository <https://github.com/jeevan4> and <http://branded.me/jeevan4>.

Prior to my Masters, I have an amazing 4 years of experience in building and maintaining a large data warehouse in production environment for Apple Inc. through Infosys Ltd. It has large database having terabytes of data implemented in the Teradata DBMS. I was involved in developing complex PL/SQL stored procedures, wrote ad-hoc SQL queries for troubleshooting and performance tuning. Developed Python and UNIX shell scripts that automated ETL pipelines, data loading and identified root causes for various bugs which resulted in maintaining the application stable and also optimized queries for reports. I also believe that I have excellent communication skills and can collaborate with the team to ensure quality work.

I wanted to share again my enthusiasm about working with such a great team, and hope to speak with you. If you need anything else, please let me know.

Thanks,
Jeevan
